                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      between the white adipose tissue (WAT) or stronal vascular tissue (SVT) of any two different mice selected from a group consisting of wild-type, HMGI-C -/-, ob/ob, or HMGI-C -/- ob/ob genotype mice. Accordingly, using this method novel nucleotides and the encoded proteins thereof were identified that are adipocyte specific, and as such can be used for preventing adipogenesis, diagnosing and treating diabetes, obesity, hypertension and cardiovascular disease, as well as screening for compounds that can modulate or prevent adipogenesis and treat diabetes or obesity. These compositions exhibit anorectic, antidiabetic and hypotensive activities. This polypeptide sequence is a human homologue of a murine adipocyte specific protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel method for identifying genes that are over-expressed in adipose tissue and as such it provides targets for anti-
obesity pharmaceutical compositions. Specifically, it refers to a high mobility group I-C protein (HMGI-C) that is associated with obesity and is epistatic to leptin, furthermore, it refers to the ob gene where an autosomal recessive trait is linked to obesity and diabetes. The present invention describes performing differential gene expression analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying adipocyte specific genes, useful for treating obesity or diabetes, and for identifying drug targets, by differential gene expression analysis between adipose tissue or stromal vascular tissue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
```

Sequence 1304 AA;

8;

Length 1304;

```
The invention relates to an isolated nucleic acid comprising at least 10 contiguous nucleotides of any of the 233 polynucleotide sequences given in the specification, or its complement. The nucleic acids encode cancer-cassociated proteins Also included are an expression vector comprising the isolated nucleic acid or expression vector, a microarray for detecting cancer-associated (CA) nucleic acid comprising at least one probe comprising at least 10 contiguous nucleotides of any of the above-comprising at least 10 contiguous nucleotides of any of the above-comprising at least 10 contiguous nucleotides of any of the above-comprising at least 10 contiguous nucleotides of any of the above-comprising at least 10 contiguous nucleotides of any of the 95 mentioned nucleotide sequences, an isolated polypeptide (encoded within comprising the above polypeptide, a hybridoma that produces the above nucleotides of the above complement), an isolated antibody, (or its antigen binding fragment) that binds to the above polypeptide, a hybridoma that produces the above antibody and a pharmaceutical composition comprising the above comprising the antibody cited above, methods for diagnosing cancer cells (comprising the presence or absence of cancer cells in an individual, a method for inhibiting growth of cancer cells in an individual, a method for inhibiting growth of cancer cells in an cell comprising cancer activity or for a bioactive agent to cancer cells in an individual, an electronic library comprising the above polypeptide of polypeptide in a test cell sample, a method for treating cancers and a methods for detecting cancer cells in a cell. The composition and methods are useful for detecting, diagnosing, preventing and treating cancers, especially lymphoma and cellustation. Preventing and treating cancers, especially lymphoma and centerior cancer and a method for inhibiting the expression of a preventing and treating cancers, especially lymphoma and cellustation, but was obtained for form part of the printed special conter
New isolated cancer-associated polynucleotides and polypeptides useful for diagnosing, preventing or treating cancers, especially lymphoma and leukemia, or in screening for agents that modulate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  claim 18; seqid 147; 310pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprising an amino acid sequence given in the specification; an antibody that specifically binds to the polypeptide or its antigen-binding fragment; an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid, comprising the polynucleotide, a buffer and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and a method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing myocardial infarction. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence represents the protein of a human myocardial infarction-
associated gene containing one or more SNP's of the invention. Note: This
sequence was not shown in the specification. The sequence has come from
an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8 contiguous nucleotides where one of the nucleotides is an SNP given the specification or its complement and encoding any one of the amino acid sequences given in the specification; an isolated polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention further comprises; an isolated nucleic acid molecule comprising at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorph the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          20-DEC-2002; 2002US-0434778P.

                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              altered risk for myocardial infarction in the individual. The invention further comprises: an isolated nuclect acid molecule comprising at least sequences in an isolated nucleotides is an SNP given in the specification or its complement and encoding any one of the amino caid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an antibody that specifically binds to the polypeptide or its antigen-binding that specification and which is between about 16 and 1000 nucleotides in the specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid, comprising the polynucleotide, a buffer and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and a method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method risk for developing myocardial infarction and for preparing a composition for treating or prevention and for preparing an individual who has an increased or decreased risk for developing myocardial infarction and for preparing and composition for treating the myocardial infarction and for preparing and composition for treating the myocardial infarction and for preparing and composition for treating the myocardial infarction and for preparing and composition for treating the myocardial infarction and for preparing and composition for treating the myocardial infarction and for preparing and composition for treating the myocardial infarction and for preparing and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best
                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1306
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction-associated gene containing one or more SUP's of the invention. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   has an altered risk for developing myocardial infarction. The method comprises detecting a single nuclectide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying an individual myocardial infarction by other individual's nucleic a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel method for identifying genes that are cover-expressed in adipose tissue and as such it provides targets for anticover-expressed in adipose tissue and as such it provides targets for anticover-expressed in adipose tissue and as such it provides targets for anticover-expressivy parmaceutical compositions. Specifically, it refers to a high combility group I-C protein (HMGI-C) that is associated with obesity and combility group I-C protein (IMGI-C) that is associated with obesity and combility and dispersed to the object with obesity and composition describes performing differential gene expression analysis composition describes performing differential gene expression analysis composition and consisting of wild-type, composition and continues selected from a group consisting of wild-type, compounds that are adipocyte specific, and as such can be used for compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can be described in the invention.
                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score

FUNCTION: Required for T-cell activation through the antigen receptor. The first PTPase domain has enzymatic activity, while the second one seems to affect the substrate specificity of the first one.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 compartment of development.

PTM: Heavily N- and O-glycosylated.

SIMILARITY: Belongs to the protein-tyrosine phosphat Receptor class 1/6 subfamily.

SIMILARITY: Contains 2 fibronectin type III domains.

SIMILARITY: Contains 2 protein-tyrosine phosphatase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        first one.
CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 =

30-NOV-2000; 2000WO-GB004566

Novel peptide comprising leukocyte antigen binding peptide of human CD45 polypeptide, useful for producing activated cytotoxic T lymphocytes, for killing cancerous cells e.g. leukemia. WPI; 2002-599413/64. Stauss Έ Amrolia PJ;

(IMCO-) IMPERIAL COLLEGE INNOVATIONS LTD

Claim 2; Page 38; 56pp; English.

The invention discloses a peptide comprising the human leukocyte antigen (HLA)-binding peptide of human CD45 polypeptide, its portion or variant, provided that the peptide is not the intact human CD45 polypeptide. The peptides are useful for producing activated cytotoxic T lymphocyte (CTL) in vitro which involves contacting the CTL with an antigen-presenting cell, where its major histocompatibility complex (MHC) class I molecules are loaded with the peptide, to activate, in an antigen specific manner, where the CTL and the antigen presenting cell are allogenic with respect to the class I MHC molecule that is presenting peptides of CD45. The

The activated CTLs are useful for killing, and in the manufacture of a medicament for, target cells corpressing the CD45 peptides in a patient. A T cell receptor (TCR), recognising cells expressing the CD45 peptides, is useful for killing target cells (cancer cells) in a patient which involves obtaining CTLs from the patient, introducing into the CTLs the polymucleotide encoding the TCR and then introducing the cells thus produced into the patient who has undergone an allogenic stem cell transplantation. Tumour reactive CTLs have been shown to mediate tumour regression in animals models by the inhibition of colony forming unit-granulocyte macrophage (CTU-CM) colony formation. The cancer is leukaemia which expresses the CD45 polypeptide. The advantage this method provides is that the CTLs destroy the malignant haematopoietic cells but not the compens the CD45 polypeptide. The advantage this method provides is that the CTLs destroy the malignant haematopoietic cells but not the than LTA binding nenticle of human CD45.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

A novel T lymphocyte veto molecule is a chimeric molecule comprising a protein, e.g. the present sequence, linked to a targetting polypeptide that binds a molecule, which differentiates a host cell from a tissue graft cell, or selectively targets a stimulator cell involved in the autoimmune response. A veto molecule, in which the protein binds.
                                                                                                                                                                                                                                                                                          Tlymphocyte veto molecule comprising response cell activating protein linked to molecule that targets stimulator cell marker, used for selective suppression of immune response, e.g. prevention of graft rejection or treatment of auto-immune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            targetting polypeptide; suppression; immune response autoimmune disease; allergy; immunological disorder; transplant rejection.
                                                                                                                                                                                                                          Claim 37; Page 70-72;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    molecule that targets stimulator cells, can be used to suppress an immune response and therefore treat autoimmune diseases, e.g. systemic lupus erythematosus, myasthenia gravis, rheumatoid arthritis, insulin dependent diabetes mellitus, multiple sclerosis, coeliac disease, autoimmune thyroiditis, Addison's or Grave's diseases and rheumatoid carditis, allergies and other immunological disorders. Where the protein binds a molecule that differentiates graft and host cells, the veto molecule can be used to reduce transplant rejection. The veto molecule provides specific regulation of particular stimulator cells that can kill graft cells or respond to autoantigens, but leave other stimulator rells unaffected, e.g. CD4 or CD8 positive cells can be regulated without one affecting the other. The veto molecule can be administered locally to minimise generalised immunosuppression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       protease; protease innibitor, cancer; MHC; receptor; transcription factor; cancer; MHC; major histocompatability complex; myeloma; cancorarcinoma; sarcoma; melanoma; lymphoma;
                                                                                                                                                                                                     New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            28-MAR-2002; 2002WO-US009671.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPP) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at
The present invention provides the protein and coding sequences of novel proteins from a variety of organisms; including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess bioddiversity and for nutritional purposes. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gene

                                                    fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. polypeptide is useful as an immunogenic composition for eliciting in mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polypuclectides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melan lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an
expressed protein tag (EPT) isolated from human tissue for trans profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format 2:
                                                                                                                                                                                                                                                                                                       New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protease; protease inhibitor; transporter; cytoskeletal receptor; transcription factor; cancer; MHC; major histocompatability complex; myeloma; colon cancer adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.
                                                                                                                                                                                                                                 The invention describes a purified polypeptide, which
                                                                                                                                                                                                                                                                                                                                                                     WPI; 2003-040607/03.
                                                                                                                                                                                                                                                                                                                                                                                                Chicz
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-MAR-2002; 2002WO-US009671

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as hisheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. polypeptide is useful as an immunogenic composition for eliciting in mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polypucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, mela lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polymucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma
